MAPP 18217

AINS 30 G/KG MESOSULFURON-METHYL AND 6 G/KG IODOSULFURON-METHYL-SOMUM AS A WATER-DISPERSIBLE GRANULE FORMULATION. NIANTIC IS AN HERBICIDE MIXTURE FOR CONTROL OF SOME GRASS AND BROAD-LEAVED WHED'S SPECIES IN WINTER WHEAT.

BATCH NO: SEE PACKAGING

SAFETY PRECAUTIONS

Operator Protection

Engineering control of operator exposure must be used where reasonably practical in addition to the following personal protective equipment:

WEAR SUITABLE PROTECTIVE CLOTHING (COVERALLS) AND SUITABLE PROTECTIVE GLOVES AND FACE PROTECTION (FACESHIELD) when handling the concentrate.

However, engineering controls may replace personal protective equipment if a COSHH assessment shows that they provide an equal or higher standard of protection.

DO NOT EAT, DRINK OR SMOKE WHEN USING THIS PRODUCT.

WASH HANDS AND EXPOSED SKIN before eating and drinking and after work.

Environmental Protection

Do not contaminate water with product or its container.

Take extreme care to avoid drift onto crops and non-target plants outside the target area.

To protect aquatic organisms, respect an unsprayed buffer zone to surface water bodies in line with LERAP requirements.

DO NOT ALLOW DIRECT SPRAY from horizonta boom sprayers to fall within 5m of the top of the bank of a static or flowing waterbody, unless a Local Environment Risk Assessment for Pesticides (LERAP) permits a narrower buffer zone, or within 1m of the top of a ditch which is dry at the time of application.

Aim spray away from water.

This product qualifies for inclusion in the Local Environment Risk assessment for Pesticides Scheme (LERAPS). Before each application from a horizontal boom spraver, either a LERAP muss be carried out in accordance with the CRI se published goldance or the statutory buffer zone must be maintained. The results of the LERAP must be recorded and kept-variable for inspection for three years to any person studed to exercise enforcement Protection Act (as amenica). Electronic renords will fulfil the requirement for a whitten record privided that it is variable for inspection and piet oplice can be made.

Storage and Disposal

KEEP OUT OF REACH OF CHILDREN

KEEP AWAY FROM FOOD, DRINK AND ANIMAL FEEDING STUFFS

KEEP IN ORIGINAL CONTAINER tightly closed in a safe place

WASH OUT CONTAINER THOROUGHLY and dispose of safely.

PROTECT FROM FROST.

DIRECTIONS FOR USE

IMPORTANT: This information is authorised as part of the Product Label. All instructions within this section must be read carefully in order to obtain safe and successful use of this product.

NIANTIC is an herbicide mixture for control of the listed grass

and broad-leaved weed species in all varieties of winter wheat. It contains two ALS-inhibitor herbicides and only one other ALSinhibiting herbicide can be applied in mixture or sequence with NIANTC to the same crop. Details of permitted mixtures and sequences are given under SEUENCES & TANK MIXTURES later in this label. It must always be used in mixture with authorised adjuvant Biopowe® (ADJ:0617) at a rate of 1L/ha.

NIANTIC is rapidly translocated within susceptible weeds and inhibits growth within hours of application. However, the development of visual symptoms in the treated weeds varies according to species, weather conditions and growth stage at application with some treated weeds taking up 64 weeks to display clear signs of herbicide actions. The rapid cessation of growth after treatment means that the veeds are no longer competing with the crop for numents. Activity is mainly through foliar uptake and good coverage of the target weeds is essential for the best control. Initial activity is therefore independent of soil type but for optimum control some soil moisture is required to allow for slight reschuel action on emerging weeds. High soil temperatures and condowsedebeds will impair this residual action.

Due to the potential for yield loss without prior signs of crop phytotoxicity, avoid use of NIANTIC to control light infestations of grass weeds.

- Do not apply to crops undersown with grasses, clover or other leaunes or any other broad-leaved crop.
- other leajing or any other broad-leaved crop.
 Avoid freatment or crops suffering from stress caused by pest or disease attack, drought or water-logging, grazing, nutrient, deficiency, compacted soils or any other factor that reduces crop growth.
- Do not apply NIANTIC during periods of frosty weather or when rain is likely to fall shortly after application.
- ANTIC is a very active herbicide. Be very careful to avoid drift on to other crops, non-target plants, waterways, ponds and ditches.
- Do not overlap spray swaths.
- Store in a frost-free, dry designated agrochemical store.

RESISTANCE MANAGEMENT

NIANTIC is classified as having the HRAC mode of action code 'B' indicating that both active ingredients are ALS inhibitors. Weeds which are subject to repeated exposure to the same modes of action such as chickweed, poppy, black-grass, wild oats and Italian rye-grass are at risk of developing resistance to these herbicides. It should be used as part of an anti-resistance strategy which includes cultural methods of control and herbicides utilising different modes of action which are effective against the target weeds. Do not use ALS-inhibitor herbicides as the sole chemical method of grass weed or chickweed control. Use in tank-mixture or sequence with herbicides employing a different mode of action.

The Weed Resistance Action Group (WRAG) has published guidelines on managing weed resistance and copies of this publication should be available from your advisor, HGCA, CPA and from your chemical distributor.

MIXING and SPRAYING

Before spraying it is important to check all hoses, filters and nozzles, and to ensure that the sprayer is clean and correctly set to give an even application at the correct volume. Half fill the spray tank with clean water. Begin agitation and add the required quantity of NIANTIC, together with authorised adjuvant Biopower® (ADJ: 0617) at a rate of 1 L/ha. Add the remainder of the water and agitate the mixture thoroughly before and during spraying. Do not leave the sprayer standing with the diluted spray in the tank.

Timing: One application of 0.4 kg/ha NIANTIC, plus authorised adjuvant Biopower® (ADJ: 0617) at a rate of 1 L/ha should be applied to small, actively-growing weeds from when the wheat has two leaves (GS12) up until the flag leaf ligule is just visible (GS39).

Application: Apply as a FINE or MEDIUM spray as defined by BCPC in a variet volume of 200 – 300 /hou using flat-fan nozzles and settings that ensure good coverage of the target weeds and penetration of the crop. Use the water volume at the higher end of the range where weed foliage or crop cover is dense. <u>DO</u> <u>NOT</u> overlap spray swathes since this may result in crop injury that causes yield reductions.

Weed Control: NIANTIC will control the following weeds in water wheat and is most effective when weeds are small and actively growing. Weeds should be emerged at the time of application and those emerging after application will not be controlled. Monitor efficacy and investigate patches of poor control of grass or broad-leaved weeds. In the absence of an obvious reason for poor activity, consider resistance testing not be seed from surviving weeds.

Weed species	Activity	Maximum growth stage (BBCH)
Annual meadow-grass	S	Post-emergence (GS31)
Black-grass (sensitive)*	S	Post-emergence (GS39)
Common chickweed	S 🔪	Post-emergence to 8 T L (GS18
Italian Rye-grass**	S.	Postremengence (GS30)
Mayweeds		Post-emergence to 8 T L (GS18)
Perennial rye-grass (from seed)		Post-emergence (GS31)
Rough-stalked meadow-grass	S	Post-emergence (GS81)
Wild oats	K S	Post-emergence (GS29)

*NIANTIC will also control black-grass that has Enhanced Metabolic Resistance up to RR or RRR levels as shown by a resistance test but will not control strains with Target-Site resistance to ALS herbicides.

** Enhance metabolic resistance in Italian Rye-grass may lead to unacceptable levels of control so apply to young, actively growing weeds when activity is likely to be greatest.

S = Susceptible;

SEQUENCES and TANK-MIXTURES

NIANTIC must only be applied in sequence or tank-mixture with <u>one</u> other ALS-inhibiting herbicide provided that all label recommendations on both components of the herbicide programme are complied with. ALS-inhibiting products which are known to be safe include:

NIANTIC may also be applied in sequence only with <u>one</u> of the following ALS-inhibiting herbicides. Note that these sequences are <u>only</u> permitted where the flupyrsulfuron product has been applied in tank-mixture with a suitable residual partner such as pendimethalin and/or flufenacet-based products prior to black-grass emergence to reduce the risk of the development of resistance in black-grass.

Active	Product
diflufenican + flupyrsulfuron-methyl	Absolute
flupyrsulfuron-methyl	Bullion
	Ductis SX
	Exceed SX
	Lexus SX
	Staka SX

To combat the risk of the development of resistance, these mixtures and sequences should only be used in conjunction with an effective autumn-applied non-ALS herbicide programme.

ALS-resistant chickweed is now present in the UK. Do not apply Chekker in sequence with NIANTIC to control chickweed to reduce the selection pressure.

CLEANING OF APPLICATION EQUIPMENT

To avoid damage to crops other than wheat, the application equipment must be thoroughly de-contaminated after application. Immediately after application, drain the tank completely and wash down with clean water.

- Finse inside of the tank with clean water and flush through boom and nozzles. Drain tank completely.
- Half fill the tank with clean water and add a proprietary sprayer cleaner (e.g. 1 litre All Clear Extra per 200 litres). Agitate and then flush the boom and hoses with the cleaning solution. Top up with water making sure the tank is completely full and allow to stand for 15 minutes with agitation. Again, flush the boom and hoses and drain tank completely.
- Nozzles and filters should be removed and cleaned separately with the proprietary sprayer cleaner as recommended.
- Rinse the tank with clean water and flush through the boom and hoses. Drain tank completely

Dispose of the washings safely. DO NOT spray onto a sensitive crop or land intended to be cropped with a sensitive crop. For disposal of washings in the UK, follow the 'Code of Practice for Using Plant Protection Products'.

FOLLOWING CROPS after normal harvest or crop failure

In the event of crop failure, only plant winter wheat in the same season as an application of NIANNC and it is has been used in tank-mixture or sequence with ene of the parmitted ALSinhibitors, check the partner laber and use the most estimative recommendation for succeeding crops.

After normal harvest of the breated crop only winter wheat, winter barley or winter oilsed rape may be hown in the same year as an application of NANTIC. The following Spring, spring wheat, spring barley, sugarbeet or spring oilseed rape may be drilled but the land must be ploughed before planting oilseed rape to avoid the risk of crop injury.

CONDITIONS OF SUPPLY

All good supplied by the company are of good quality and we believe them to be fit for purpose. However, as we cannot exercise control over their storage, handling, mixing or use or the weather conditions before, during or after application, which may affect the performance of the goods, all conditions and warranties, statutory or otherwise, as to the quality or fitness for any purpose of our goods are excluded, and no responsibility will be accepted by us or re-sellers for amy failure in performance, damage or injury whatsoever arising from their storage, handling, application or use. These conditions cannot be varied by our staff or agents whether or not they supervise or assist in the use of such goods.

Brands listed are Trade Marks of other manufacturers where proprietary rights may exist.
